How to shift device in Doze Mode (Android Preview M / Marshmallow)?

[Get started](#)

I followed steps described here:

<https://developer.android.com/preview/testing/guide.html#doze-standby>

Circumstances:

- Android Debug Bridge version 1.0.32
- Nexus 9 with Preview M

Shell:

```
$ adb shell dumpsys battery unplug
```

=> worked, device unplugged

```
$ adb shell dumpsys deviceidle step
```

=> Output: Stepped to: ACTIVE

```
$ adb shell dumpsys deviceidle -h
```

=> does not work => Output:

```
Device idle controller (deviceidle) dump options:
```

```
[-h] [CMD]
```

```
-h: print this help text.
```

Commands:

step

disable

enable

whitelist

I tried it with:

```
adb shell dumpsys deviceidle enable
```

But it didn't work.

So my question, as mentioned above, how to shift the device in Doze-Mode? What did i make wrong?

EDIT - JUNE, 2016:
