人脸检测(2) -**☵** 分类:

■ 版权声明:本文为博主原创文章,未经博主允许不得转载。

开源代码: https://github.com/luoyetx/JDA

好的介绍博客:http://www.cvrobot.net/joint-cascade-face-detection-and-alignment/

思路:将人脸矫正和检测一起做,矫正来提升检测准确率

先验证矫正对检测有效,检测后分类器:对OpenCV Haar产生的3000个窗口处理, 27facial points SIFT feature + **SVM**

级联检测及矫正原理

级联检测:

$$f^N = \sum_{i=1}^N \mathcal{C}^i(\mathbf{x})$$

级联矫正:逐步对人脸外形S更新,

$$\mathbf{S}^{t} = \mathbf{S}^{t-1} + \mathcal{R}^{t}(\mathbf{x}, \mathbf{S}^{t-1}), t = 1, ..., T.$$

最小化Groundtruth与当前shape的误差,

$$\mathcal{R}^t = \arg\min_{\mathcal{R}} \sum_i ||\hat{\mathbf{S}}_i - (\mathbf{S}_i^{t-1} + \mathcal{R}(\mathbf{x}_i, \mathbf{S}_i^{t-1}))||^2$$

让级联检测依赖于级联回归shape S,

$$f = \sum_{t=1}^{T} \sum_{k=1}^{K} \mathcal{C}_k^t(\mathbf{x}, \mathbf{S}^{t-1})$$

联合训练检测和矫正的算法:

```
Algorithm 3 Training of cascade and joint face detection and alignment.
 1: Input: all training samples \{x_i\}, class labels \{y_i\}
 2: Input: ground truth shapes \hat{\mathbf{S}}_i for positive samples, y_i = 1
 3: Output: all weak learners \{CR_k^t\}, classification thresholds \{\theta_k^t\}
 4: set the initial face shapes S_i^0 as random perturbations of the mean shapes in win-
    dows of x_i
 5: set all initial classification scores f_i = 0
 6: for t = 1 to T do
      for k = 1 to K do
         for each training sample i do
 9:
            compute its weight w_i according to Eq. (6)
         end for
10:
         select a point (k \mod L) for regression /*local learning in Section 4.1 /
11:
         learn the structure of classification/regression tree \mathcal{CR}_k^t as in Sectic
12:
         for each tree leaf do
13:
14:
            set its classification score according to Eq. (7)
15:
         end for
         for each training sample i do
16:
            update its classification score as f_i = f_i + \mathcal{CR}_k^t(\mathbf{x}_i, \mathbf{S}_i^{t-1})
17:
18:
         end for
         use all \{f_i\} to set the bias \theta_k^t, according to a preset precision-recall condition
19:
         remove samples whose f_i < \theta_k^t from training set
20:
         perform hard negative sample mining if negative samples are insufficient
21:
22:
       end for
23:
       learn the shape increments of all leaves /* global learning in Section 4.1 */
       compute S_i^t for all samples according to Eq. (2) and (5)
24:
25: end for
```

人脸识别 -Do We Really Need to

测试的算法:

Algorithm 2 Our testing algorithm for cascade face detection and alignment for an image window x. The model consists of all weak learners $\{CR_k^t\}$ and classification thresholds $\{\theta_k^t\}$.

```
1: initialize the face shape S as the mean shape in window of x
 2: initialize the detection score f = 0
 3: for t = 1 to T do
       \Delta S = 0
       for k = 1 to K do
         (f', \Delta S') = \mathcal{CR}_k^t(\mathbf{x}, S)
         f = f + f'
         if f < \theta_k^t then
 9:
             return "not a face"
10:
          end if
          \Delta S = \Delta S + \Delta S'
11:
12:
       end for
       S = S + \Delta S
13:
14: end for
15: return "is a face with shape S"
```
