10 Minutes to pandas

This is a short introduction to pandas, geared mainly for new users. You can see more complex recipes in the Cookbook

Customarily, we import as follows:

```
In [1]: import pandas as pd
In [2]: import numpy as np
In [3]: import matplotlib.pyplot as plt
```

Object Creation

See the Data Structure Intro section

Creating a Series by passing a list of values, letting pandas create a default integer index:

```
In [4]: s = pd.Series([1,3,5,np.nan,6,8])
In [5]: s
Out[5]:
0 1.0
1 3.0
2 5.0
3 NaN
4 6.0
5 8.0
dtype: float64
```

Creating a DataFrame by passing a numpy array, with a datetime index and labeled columns:

```
In [6]: dates = pd.date_range('20130101', periods=6)
In [7]: dates
Out[7]:
DatetimeIndex(['2013-01-01', '2013-01-02', '2013-01-03', '2013-01-04',
```

第1页 共33页 2017/10/20 上午10:54

Creating a DataFrame by passing a dict of objects that can be converted to series-like.

```
In [10]: df2 = pd.DataFrame({ 'A' : 1., }
                  'B': pd.Timestamp('20130102'),
                  'C': pd.Series(1,index=list(range(4)),dtype='float32'),
                 'D': np.array([3] * 4,dtype='int32'),
                 'E': pd.Categorical(["test", "train", "test", "train"]),
                 'F': 'foo' })
 ....
 ....:
In [11]: df2
Out[11]:
   Α
          BCDEF
0 1.0 2013-01-02 1.0 3 test foo
1 1.0 2013-01-02 1.0 3 train foo
2 1.0 2013-01-02 1.0 3 test foo
3 1.0 2013-01-02 1.0 3 train foo
```

Having specific dtypes

```
In [12]: df2.dtypes
Out[12]:
A float64
B datetime64[ns]
C float32
D int32
E category
```

第2页 共33页 2017/10/20 上午10:54

```
object
dtype: object
```

If you're using IPython, tab completion for column names (as well as public attributes) is automatically enabled. Here's a subset of the attributes that will be completed:

```
In [13]: df2.<TAB>
df2.A
               df2.bool
df2.abs
                df2.boxplot
df2.add
                df2.C
df2.add_prefix
                  df2.clip
df2.add_suffix
                  df2.clip_lower
df2.align
                df2.clip_upper
df2.all
               df2.columns
                df2.combine
df2.anv
df2.append
                  df2.combine first
df2.apply
                df2.compound
df2.applymap
                   df2.consolidate
df2.as blocks
                  df2.convert_objects
df2.asfreq
                 df2.copy
df2.as_matrix
                  df2.corr
df2.astype
                 df2.corrwith
               df2.count
df2.at
df2.at_time
                 df2.cov
df2.axes
                df2.cummax
df2.B
               df2.cummin
df2.between_time
                    df2.cumprod
               df2.cumsum
df2.bfill
df2.blocks
                 df2.D
```

As you can see, the columns A, B, C, and D are automatically tab completed. E is there as well; the rest of the attributes have been truncated for brevity.

Viewing Data

See the Basics section

See the top & bottom rows of the frame

```
In [14]: df.head()
```

第3页 共33页 2017/10/20 上午10:54

```
Out[14]:
                B C
                            D
2013-01-01 0.469112 -0.282863 -1.509059 -1.135632

Selection

Note: While standard Python / Numpy expressions for selecting and setting are intuitive and come in handy for interactive work, for production code, we recommend the optimized pandas data access methods, .at, .iat, .loc, .iloc and .ix.

See the indexing documentation Indexing and Selecting Data and MultiIndex / Advanced Indexing

Getting

Selecting a single column, which yields a Series, equivalent to df.A

```
In [23]: df['A']
Out[23]:
2013-01-01 0.469112
2013-01-02 1.212112
2013-01-03 -0.861849
2013-01-04 0.721555
2013-01-05 -0.424972
2013-01-06 -0.673690
Freq: D, Name: A, dtype: float64
```

Selecting via [], which slices the rows.

```
In [24]: df[0:3]
Out[24]:
                В
                      C
                             D
2013-01-01 0.469112 -0.282863 -1.509059 -1.135632
2013-01-02 1.212112 -0.173215 0.119209 -1.044236
2013-01-03 -0.861849 -2.104569 -0.494929 1.071804
In [25]: df['20130102':'20130104']
Out[25]:
          Α
                В
                      C
                             D
2013-01-02 1.212112 -0.173215 0.119209 -1.044236
2013-01-03 -0.861849 -2.104569 -0.494929 1.071804
2013-01-04 0.721555 -0.706771 -1.039575 0.271860
```

Selection by Label

See more in Selection by Label

For getting a cross section using a label

```
In [26]: df.loc[dates[0]]
Out[26]:
A 0.469112
B -0.282863
C -1.509059
D -1.135632
Name: 2013-01-01 00:00:00, dtype: float64
```

Selecting on a multi-axis by label

```
In [27]: df.loc[:,['A','B']]
Out[27]:
2013-01-01 0.469112 -0.282863
2013-01-02 1.212112 -0.173215
2013-01-03 -0.861849 -2.104569
2013-01-04 0.721555 -0.706771
2013-01-05 -0.424972 0.567020
2013-01-06 -0.673690 0.113648
```

Showing label slicing, both endpoints are included

```
In [28]: df.loc['20130102':'20130104',['A','B']]
Out[28]:
                 В
          Α
2013-01-02 1.212112 -0.173215
2013-01-03 -0.861849 -2.104569
2013-01-04 0.721555 -0.706771
```

Reduction in the dimensions of the returned object

```
In [29]: df.loc['20130102',['A','B']]
Out[29]:
```

第7页 共33页 2017/10/20 上午10:54

```
A 1.212112
B -0.173215
```

Name: 2013-01-02 00:00:00, dtype: float64

For getting a scalar value

```
In [30]: df.loc[dates[0],'A']
Out[30]: 0.46911229990718628
```

For getting fast access to a scalar (equiv to the prior method)

```
In [31]: df.at[dates[0],'A']
Out[31]: 0.46911229990718628
```

Selection by Position

See more in Selection by Position

Select via the position of the passed integers

```
In [32]: df.iloc[3]
Out[32]:
A 0.721555
B -0.706771
C -1.039575
D 0.271860
Name: 2013-01-04 00:00:00, dtype: float64
```

By integer slices, acting similar to numpy/python

```
In [33]: df.iloc[3:5,0:2]
Out[33]:
2013-01-04 0.721555 -0.706771
2013-01-05 -0.424972 0.567020
```

By lists of integer position locations, similar to the numpy/python style

第8页 共33页 2017/10/20 上午10:54

```
In [34]: df.iloc[[1,2,4],[0,2]]
Out[34]:
                 C
2013-01-02 1.212112 0.119209
2013-01-03 -0.861849 -0.494929
2013-01-05 -0.424972 0.276232
```

For slicing rows explicitly

```
In [35]: df.iloc[1:3,:]
Out[35]:
                В
                       C
                             D
2013-01-02 1.212112 -0.173215 0.119209 -1.044236
2013-01-03 -0.861849 -2.104569 -0.494929 1.071804
```

For slicing columns explicitly

```
In [36]: df.iloc[:,1:3]
Out[36]:
                 \mathsf{C}
2013-01-01 -0.282863 -1.509059

2013-01-03 -2.104569 -0.494929
2013-01-04 -0.706771 -1.039575
2013-01-05 0.567020 0.276232
2013-01-06 0.113648 -1.478427
```

For getting a value explicitly

```
In [37]: df.iloc[1,1]
Out[37]: -0.17321464905330858
```

For getting fast access to a scalar (equiv to the prior method)

```
In [38]: df.iat[1,1]
Out[38]: -0.17321464905330858
```

第9页 共33页 2017/10/20 上午10:54

Boolean Indexing

Using a single column's values to select data.

```
In [39]: df[df.A > 0]
Out[39]:

A B C D
2013-01-01 0.469112 -0.282863 -1.509059 -1.135632
2013-01-02 1.212112 -0.173215 0.119209 -1.044236
2013-01-04 0.721555 -0.706771 -1.039575 0.271860
```

Selecting values from a DataFrame where a boolean condition is met.

```
In [40]: df[df > 0]
Out[40]:
               В
                     C
                          D
2013-01-01 0.469112
                      NaN
                             NaN
                                     NaN
2013-01-02 1.212112
                      NaN 0.119209
                                      NaN
                           NaN 1.071804
2013-01-03
             NaN
                    NaN
2013-01-04 0.721555
                      NaN
                             NaN 0.271860
2013-01-05
            NaN 0.567020 0.276232
                                      NaN
2013-01-06
             NaN 0.113648
                             NaN 0.524988
```

Using the isin() method for filtering:

```
In [41]: df2 = df.copy()
In [42]: df2['E'] = ['one', 'one', 'two', 'three', 'four', 'three']
In [43]: df2
Out[43]:
                        C
                 В
                               D
2013-01-01 0.469112 -0.282863 -1.509059 -1.135632
                                                       one
2013-01-02 1.212112 -0.173215 0.119209 -1.044236
                                                       one
2013-01-03 -0.861849 -2.104569 -0.494929 1.071804 two

```
A B C D E
2013-01-03 -0.861849 -2.104569 -0.494929 1.071804 two
2013-01-05 -0.424972 0.567020 0.276232 -1.087401 four
```

Setting

Setting a new column automatically aligns the data by the indexes

Setting values by label

```
In [48]: df.at[dates[0],'A'] = 0
```

Setting values by position

```
In [49]: df.iat[0,1] = 0
```

Setting by assigning with a numpy array

```
In [50]: df.loc[:,'D'] = np.array([5] * len(df))
```

The result of the prior setting operations

第11页 共33页 2017/10/20 上午10:54

```
In [51]: df
Out[51]:

A B C D F

2013-01-01 0.000000 0.000000 -1.509059 5 NaN

2013-01-02 1.212112 -0.173215 0.119209 5 1.0

2013-01-03 -0.861849 -2.104569 -0.494929 5 2.0

Missing Data

pandas primarily uses the value np.nan to represent missing data. It is by default not included in computations. See the Missing Data section

Reindexing allows you to change/add/delete the index on a specified axis. This returns a copy of the data.

```
In [55]: df1 = df.reindex(index=dates[0:4], columns=list(df.columns) + ['E'])
In [56]: df1.loc[dates[0]:dates[1],'E'] = 1
In [57]: df1
Out[57]:
```

String Methods

Series is equipped with a set of string processing methods in the *str* attribute that make it easy to operate on each element of the array, as in the code snippet below. Note that pattern-matching in *str* generally uses regular expressions by default (and in some cases always uses them). See more at Vectorized String Methods.

```
In [71]: s = pd.Series(['A', 'B', 'C', 'Aaba', 'Baca', np.nan, 'CABA', 'dog', 'cat'])

Merge

Concat

pandas provides various facilities for easily combining together Series, DataFrame, and Panel objects with various kinds of set logic for the indexes and relational algebra functionality in the case of join / merge-type operations.

See the Merging section

Concatenating pandas objects together with concat():

```
In [73]: df = pd.DataFrame(np.random.randn(10, 4))
In [74]: df
Out[74]:
                 2
     0

Join

SQL style merges. See the Database style joining

```
In [77]: left = pd.DataFrame({'key': ['foo', 'foo'], 'lval': [1, 2]})
In [78]: right = pd.DataFrame({'key': ['foo', 'foo'], 'rval': [4, 5]})
In [79]: left
Out[79]:
  key Ival
0 foo
         1
1 foo
         2
In [80]: right
Out[80]:
  key rval
0 foo
         4
1 foo
         5
In [81]: pd.merge(left, right, on='key')
Out[81]:
  key Ival rval
0 foo
        1
1 foo
         1
             5
2 foo
         2
           4
             5
3 foo
         2
```

Another example that can be given is:

```
In [82]: left = pd.DataFrame({'key': ['foo', 'bar'], 'lval': [1, 2]})
In [83]: right = pd.DataFrame({'key': ['foo', 'bar'], 'rval': [4, 5]})
In [84]: left
Out[84]:
  key Ival
0 foo
1 bar
         2
```

第18页 共33页 2017/10/20 上午10:54

```
In [85]: right
Out[85]:
  key rval
0 foo  4
1 bar  5

In [86]: pd.merge(left, right, on='key')
Out[86]:
  key lval rval
0 foo  1  4
1 bar  2  5
```

Append

Append rows to a dataframe. See the Appending

```
In [87]: df = pd.DataFrame(np.random.randn(8, 4), columns=['A','B','C','D'])
In [88]: df
Out[88]:

```

Grouping

By "group by" we are referring to a process involving one or more of the following steps

- Splitting the data into groups based on some criteria
- Applying a function to each group independently
- Combining the results into a data structure

See the Grouping section

```
In [91]: df = pd.DataFrame({'A' : ['foo', 'bar', 'foo', 'bar',
                    'foo', 'bar', 'foo', 'foo'],
                'B': ['one', 'one', 'two', 'three',
 ....
                    'two', 'two', 'one', 'three'],
                'C': np.random.randn(8),
                'D': np.random.randn(8)})
 ....:
 ....
In [92]: df
Out[92]:
  Α
              C
                     D
0 foo one -1.202872 -0.055224
1 bar one -1.814470 2.395985
2 foo two 1.018601 1.552825
3 bar three -0.595447 0.166599
4 foo two 1.395433 0.047609
5 bar two -0.392670 -0.136473
6 foo one 0.007207 -0.561757
7 foo three 1.928123 -1.623033
```

Grouping and then applying a function sum to the resulting groups.

第20页 共33页 2017/10/20 上午10:54

Grouping by multiple columns forms a hierarchical index, which we then apply the function.

```
In [94]: df.groupby(['A','B']).sum()
Out[94]:

C D

A B

bar one -1.814470 2.395985

three -0.595447 0.166599

two -0.392670 -0.136473
foo one -1.195665 -0.616981

three 1.928123 -1.623033

two 2.414034 1.600434
```

Reshaping

See the sections on Hierarchical Indexing and Reshaping.

Stack

```
In [95]: tuples = list(zip(*[['bar', 'bar', 'baz', 'baz',
                  'foo', 'foo', 'qux', 'qux'],
 ....:
                 ['one', 'two', 'one', 'two',
 ....:
                  'one', 'two', 'one', 'two']]))
 ....:
 ....:
In [96]: index = pd.MultiIndex.from_tuples(tuples, names=['first', 'second'])
In [97]: df = pd.DataFrame(np.random.randn(8, 2), index=index, columns=['A', 'B'])
In [98]: df2 = df[:4]
In [99]: df2
Out[99]:
                    В
             Α
first second
bar one
            0.029399 -0.542108
   two
         0.282696 -0.087302
baz one -1.575170 1.771208
          0.816482 1.100230
   two
```

第21页 共33页 2017/10/20 上午10:54

The stack() method "compresses" a level in the DataFrame's columns.

```
In [100]: stacked = df2.stack()
In [101]: stacked
Out[101]:
first second
bar one A 0.029399
       B -0.542108
   two A 0.282696
       B -0.087302
baz one A -1.575170
       B 1.771208
   two A 0.816482
       B 1.100230
dtype: float64
```

With a "stacked" DataFrame or Series (having a MultiIndex as the index), the inverse operation of stack() is unstack(), which by default unstacks the last level:

```
In [102]: stacked.unstack()
Out[102]:
                 В
           Α
first second
bar one 0.029399 -0.542108
   two
        0.282696 -0.087302
baz one -1.575170 1.771208
         0.816482 1.100230
   two
In [103]: stacked.unstack(1)
Out[103]:
second
          one
                  two
first
bar A 0.029399 0.282696
   B -0.542108 -0.087302
baz A -1.575170 0.816482
   B 1.771208 1.100230
In [104]: stacked.unstack(0)
Out[104]:
first
        bar
                baz
second
```

第22页 共33页 2017/10/20 上午10:54

```
one A 0.029399 -1.575170
B -0.542108 1.771208
two A 0.282696 0.816482
B -0.087302 1.100230
```

Pivot Tables

See the section on Pivot Tables.

```
In [105]: df = pd.DataFrame({'A' : ['one', 'one', 'two', 'three'] * 3,
                'B': ['A', 'B', 'C'] * 4,
                'C': ['foo', 'foo', 'foo', 'bar', 'bar', 'bar'] * 2,
 .....
                'D': np.random.randn(12),
                'E': np.random.randn(12)})
 ....:
In [106]: df
Out[106]:
    A B C
                D
                       Ε
  one A foo 1.418757 -0.179666
0
1 one B foo -1.879024 1.291836
2 two C foo 0.536826 -0.009614
3 three A bar 1.006160 0.392149
4 one B bar -0.029716 0.264599
5 one C bar -1.146178 -0.057409
6 two A foo 0.100900 -1.425638
7 three B foo -1.035018 1.024098
  one C foo 0.314665 -0.106062
9 one A bar -0.773723 1.824375
10 two B bar -1.170653 0.595974
11 three C bar 0.648740 1.167115
```

We can produce pivot tables from this data very easily:

```
In [107]: pd.pivot_table(df, values='D', index=['A', 'B'], columns=['C'])
Out[107]:
C bar foo
A B
one A -0.773723 1.418757
B -0.029716 -1.879024
C -1.146178 0.314665
```

第23页 共33页 2017/10/20 上午10:54

```
three A 1.006160 NaN
B NaN -1.035018
C 0.648740 NaN
two A NaN 0.100900
B -1.170653 NaN
C NaN 0.536826
```

Time Series

pandas has simple, powerful, and efficient functionality for performing resampling operations during frequency conversion (e.g., converting secondly data into 5-minutely data). This is extremely common in, but not limited to, financial applications. See the Time Series section

```
In [108]: rng = pd.date_range('1/1/2012', periods=100, freq='S')

In [109]: ts = pd.Series(np.random.randint(0, 500, len(rng)), index=rng)

In [110]: ts.resample('5Min').sum()
Out[110]:
2012-01-01 25083
Freq: 5T, dtype: int64
```

Time zone representation

第24页 共33页 2017/10/20 上午10:54

Convert to another time zone

Converting between time span representations

```
In [117]: rng = pd.date_range('1/1/2012', periods=5, freq='M')
In [118]: ts = pd.Series(np.random.randn(len(rng)), index=rng)
In [119]: ts
Out[119]:
2012-01-31 -1.134623
2012-02-29 -1.561819
2012-03-31 -0.260838
2012-04-30 0.281957
2012-05-31 1.523962
Freq: M, dtype: float64
In [120]: ps = ts.to_period()
In [121]: ps
Out[121]:
2012-01 -1.134623
2012-02 -1.561819
2012-03 -0.260838
2012-04 0.281957
2012-05 1.523962
```

第25页 共33页 2017/10/20 上午10:54

```
In [122]: ps.to_timestamp()
Out[122]:
2012-01-01 -1.134623
2012-02-01 -1.561819
2012-03-01 -0.260838
2012-04-01 0.281957
2012-05-01 1.523962
Freq: MS, dtype: float64
```

Converting between period and timestamp enables some convenient arithmetic functions to be used. In the following example, we convert a quarterly frequency with year ending in November to 9am of the end of the month following the quarter end:

```
In [123]: prng = pd.period_range('1990Q1', '2000Q4', freq='Q-NOV')

In [124]: ts = pd.Series(np.random.randn(len(prng)), prng)

In [125]: ts.index = (prng.asfreq('M', 'e') + 1).asfreq('H', 's') + 9

In [126]: ts.head()
Out[126]:
1990-03-01 09:00   -0.902937
1990-06-01 09:00   0.068159
1990-09-01 09:00   -0.057873
1990-12-01 09:00   -0.368204
1991-03-01 09:00   -1.144073
Freq: H, dtype: float64
```

Categoricals

Since version 0.15, pandas can include categorical data in a DataFrame. For full docs, see the categorical introduction and the API documentation.

```
In [127]: df = pd.DataFrame({"id":[1,2,3,4,5,6], "raw_grade":['a', 'b', 'b', 'a', 'a', 'e']})
```

Convert the raw grades to a categorical data type.

第26页 共33页 2017/10/20 上午10:54

```
In [128]: df["grade"] = df["raw_grade"].astype("category")
In [129]: df["grade"]
Out[129]:
0 a
1 b
2 b
   а
4 a
5
Name: grade, dtype: category
Categories (3, object): [a, b, e]
```

Rename the categories to more meaningful names (assigning to Series.cat.categories is inplace!)

```
In [130]: df["grade"].cat.categories = ["very good", "good", "very bad"]
```

Reorder the categories and simultaneously add the missing categories (methods under Series .cat return a new Series per default).

```
In [131]: df["grade"] = df["grade"].cat.set_categories(["very bad", "bad", "medium", "go
In [132]: df["grade"]
Out[132]:
0 very good
1
      good
2
      good
3 very good
4 very good
   very bad
Name: grade, dtype: category
Categories (5, object): [very bad, bad, medium, good, very good]
```

Sorting is per order in the categories, not lexical order.

```
In [133]: df.sort_values(by="grade")
Out[133]:
 id raw grade
                 grade
```

第27页 共33页 2017/10/20 上午10:54

```
e very bad
1 2
              good
2 3 b
             good
good
u 1 a very good
3 4 a very
         a very good
```

Grouping by a categorical column shows also empty categories.

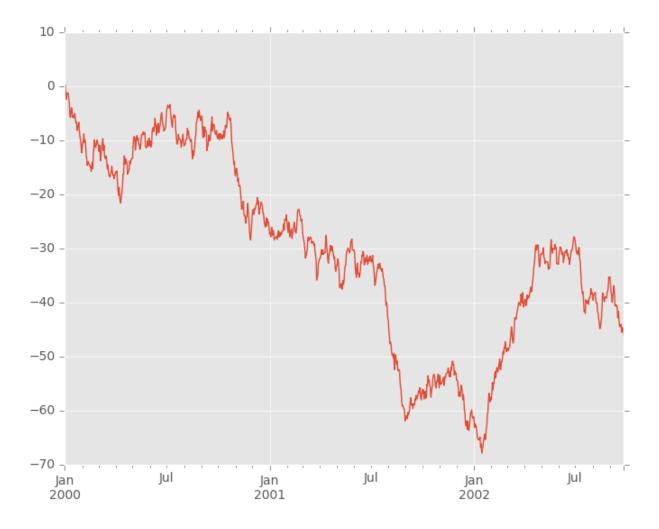

```
In [134]: df.groupby("grade").size()
Out[134]:
grade
very bad
bad
medium
good
very good 3
dtype: int64
```

Plotting

Plotting docs.

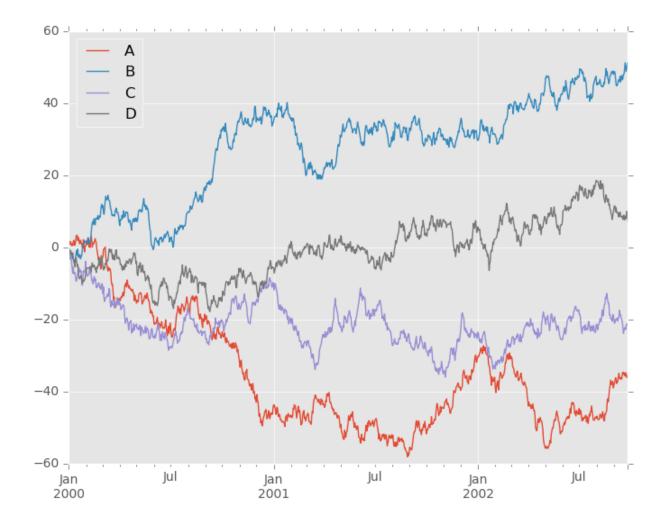

```
In [135]: ts = pd.Series(np.random.randn(1000), index=pd.date_range('1/1/2000', peri
In [136]: ts = ts.cumsum()
In [137]: ts.plot()
Out[137]: <matplotlib.axes._subplots.AxesSubplot at 0x1187d7278>
```

第28页 共33页 2017/10/20 上午10:54

On DataFrame, plot() is a convenience to plot all of the columns with labels:
